

# The rv Package

November 17, 2005

**Title** Simulation-based random variable object class in R

**Version** 0.911

**Date** 2005/11/17

**Author** Jouni Kerman <jouni@kerman.com>

**Maintainer** Jouni Kerman <jouni@kerman.com>

**Description** Simulation-based random variable object class

**Namespace** rv

**Depends** R(>= 1.9.0)

**License** GPL version 2 or newer

## R topics documented:

|                                         |    |

**Math.rv***Mathematical functions and Operators for rv Objects*

---

**Description**

Mathematical functions and operators adapted to work with random variable (rv) objects.

**Usage**

```
Math.rv(x, ...)  
Ops.rv(e1, e2)
```

**Arguments**

|     |                                                   |
|-----|---------------------------------------------------|
| x   | object                                            |
| e1  | object                                            |
| e2  | object                                            |
| ... | further arguments passed to or from other methods |

**Details****Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```
x <- rvmnorm(10)  
-x  
x + 1:10  
cumsum(x)  
cumprod(exp(x))
```

---

|           |                       |
|-----------|-----------------------|
| abline.rv | <i>Random Vectors</i> |
|-----------|-----------------------|

---

**Description**

abline.rv plots  $n$  lines corresponding to  $n$  first simulations of rv object  $x$

**Usage**

```
abline.rv(x, sims=1:20, ...)
```

**Arguments**

|      |                                                   |
|------|---------------------------------------------------|
| $x$  | an object                                         |
| sims | number of lines to draw                           |
| ...  | further arguments passed to or from other methods |

**Details**

...

**Author(s)**

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```
#
```

---

|            |                                                   |
|------------|---------------------------------------------------|
| as.rv.bugs | <i>Coerce an R2WinBUGS object to an rv object</i> |
|------------|---------------------------------------------------|

---

**Description**

as.rv.bugs coerces an R2WinBUGS object to an rv object.

**Usage**

```
as.rv.bugs(x)
```

**Arguments**

|     |                           |
|-----|---------------------------|
| $x$ | a bugs (R2WinBUGS) object |
|-----|---------------------------|

**Details****Value**

A random vector with the names attribute set to the names of the parameters.

**Author(s)**

Jouni Kerman (kerman@stat.columbia.edu) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**See Also**

[split.rv](#) to split the named random vector so you can “attach” it with [rvattach](#).

---

|              |                            |
|--------------|----------------------------|
| as.vector.rv | <i>Coerce an rv object</i> |
|--------------|----------------------------|

---

**Description**

as.vector.rv coerces a given rv object into a vector; matrices lose their dimension attributes, but rv objects stay as rv objects (since they are considered to be “vectors”).

**Usage**

```
as.vector.rv(x, mode="any")
```

**Arguments**

|      |                      |
|------|----------------------|
| x    | an object            |
| mode | (currently not used) |

**Details**

as.vector.rv removes the dimension attribute and returns the rv object. Needed for compatibility with code that uses as.vector.

**Author(s)**

Jouni Kerman (kerman@stat.columbia.edu) <http://www.stat.columbia.edu/~kerman>

**References**

**Examples**

```
#
```

---

|                       |                                                  |
|-----------------------|--------------------------------------------------|
| <code>cbind.rv</code> | <i>Combine random vectors by columns or rows</i> |
|-----------------------|--------------------------------------------------|

---

### Description

Combines random vectors by columns (`cbind.rv`) or rows (`rbind.rv`).

### Usage

```
cbind.rv(..., deparse.level = 1)
rbind.rv(..., deparse.level = 1)
```

### Arguments

`...` vectors or matrices, can be rv objects  
`deparse.level` (passed on to `cbind`)

### Details

See [cbind](#) and [rbind](#) for details.

### Author(s)

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

### References

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

### Examples

```
x <- rvmnorm(10)
y <- rvmnorm(10)
cbind(x,y)
rbind(x,y)
```

---

|                       |                         |
|-----------------------|-------------------------|
| <code>constant</code> | <i>Constant Vectors</i> |
|-----------------------|-------------------------|

---

### Description

Tests or coerces objects that are non-random.

**Usage**

```
is.constant(x)
## S3 method for class 'rv':
is.constant(x)
## Default S3 method:
is.constant(x)
## S3 method for class 'rvsim':
is.constant(x)
as.constant(x)
## S3 method for class 'rvsim':
as.constant(x)
## S3 method for class 'rv':
as.constant(x)
```

**Arguments**

**x** an object, random variable (rv) or not

**Details**

`is.constant` returns TRUE for each component of the argument object if the implied variance (sample variance of the simulations) is zero or if there is only one simulation (that is, the variable is “constant”).

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```
is.constant(1)          # TRUE
is.constant(rvnorm(1))  # FALSE
```

---

**Covariance/Variance Statistic**

*Distribution of the Covariance Statistic of a Random Vector and Array*

---

**Description**

COV

**Usage**

```
cov(x, y=NULL, ...)  
var(x, ...)
```

**Arguments**

`x`                      an object

`y`

`...`                    further arguments passed to or from other methods

**Details**

`COV` gives the distribution (that is, a random variable object) of the covariance statistic, as computed by the standard R function `COV`.

This is implemented simply by applying the numerical `COV` function to the rows of the simulation matrices of `x` and `y` and forming a new `rv` object from the resulting vector of simulations.

Similarly, `var` computes the variance.

This has been implemented by “trapping” the original function `COV` since `COV` is not a generic method.

**Value**

A random vector or array.

**Author(s)**

Jouni Kerman (kerman@stat.columbia.edu) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**See Also**

See `COV` for details.

**Examples**

```
#
```

---

`detachrv`

*Detach the rv package*

---

**Description**

`detachrv` detaches the `rv` package and restores the original functions in base and stats packages. Currently equivalent to `detach("package:rv")`.

**Usage**

```
detachrv()
```

**Details**

```
detachrv
```

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```
## Not run:
library(rv)
detachrv()

## End(Not run)
```

---

doc

---

*Show a document (pdf) file from the package directory*

---

**Description**

Show a document file (a pdf file) from the package "doc" directory

**Usage**

```
doc(topic, package = NULL, lib.loc=NULL)
```

**Arguments**

|                      |                                                                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>topic</code>   | a character string giving the (base) name of the pdf file to view. If omitted, all available pdf files are listed.                                                                 |
| <code>package</code> | a character vector with the names of packages to search through, or NULL in which case all available packages in the library trees specified by <code>lib.loc</code> are searched. |
| <code>lib.loc</code> | a character vector of directory names of R libraries, or NULL. The default value of NULL corresponds to all libraries currently known.                                             |

**Details**

If "package" is omitted, all packages are scanned for the file name.

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```
## Not run: doc("rv")
## Not run: doc("R2WinBUGS")
```

---

|         |                                     |
|---------|-------------------------------------|
| hist.rv | <i>Histogram of a random vector</i> |
|---------|-------------------------------------|

---

**Description**

hist.rv shows a grid of histograms generated from random draws of the random vector argument.

**Usage**

```
## S3 method for class 'rv':
hist(x, grid = c(4, 5), xlim = x.range, main = paste(xname, "simulation"), ...)
```

**Arguments**

|      |                                                                                 |
|------|---------------------------------------------------------------------------------|
| x    | an object                                                                       |
| grid | a vector of two numbers, indicating the size of the grid to plot the histograms |
| xlim | x limits                                                                        |
| main | main title                                                                      |
| ...  | Other arguments passed on to <a href="#">hist</a>                               |

**Examples**

```
x <- rvnorm(30)
hist(x)
```

---

**hrvplot***Horizontal interval plot of components of a random vector*

---

**Description**

hrvplot plots uncertainty (that is, “credible”) intervals for the scalar components of the given random vector.

**Usage**

```
hrvplot(x, labels=NULL, pos=NULL, output.file=NULL)
## S3 method for class 'matrix':
hrvplot(x, labels, pos=NULL, output.file=NULL)
## S3 method for class 'rv':
hrvplot(x, labels=NULL, ...)
```

**Arguments**

|             |                              |
|-------------|------------------------------|
| x           | an object                    |
| labels      | alternative labeling         |
| pos         |                              |
| output.file | alternative output file name |
| ...         |                              |

**Details**

hrvplot

**Examples**

```
#
```

---

|              |                                  |
|--------------|----------------------------------|
| is.atomic.rv | <i>Random vectors are atomic</i> |
|--------------|----------------------------------|

---

**Description**

is.atomic(x) returns TRUE for rv objects. This is necessary to make R believe that rvs are as good as other vectors.

**Usage**

```
## S3 method for class 'rv':
is.atomic(x)
```

**Arguments**

x                      an object

**Details**

is.atomic.rv

**Author(s)**

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```
is.atomic(rvnorm(1)) # TRUE, believe it or not.
```

---

|          |                                                               |
|----------|---------------------------------------------------------------|
| is.na.rv | <i>Distribution of the Indicator Function of Missing Data</i> |
|----------|---------------------------------------------------------------|

---

**Description**

is.na.rv

**Usage**

```
## S3 method for class 'rv':
is.na(x)
```

**Arguments**

x                      an rv object

**Details**

Internally, `is.na.rv` applies the function `is.na` to each simulation of each component of the argument vector.

**Value**

A “Bernoulli” random vector of the same length and dimension as those of `x`.

**Description**

mcmcarray

**Usage**

```
mcmcarray(x)
```

**Arguments**

x                      an rv object that was coerced from a three-way array

**Details**

mcmcarray

**Value**

A three-way array.

**Author(s)**

Jouni Kerman (kerman@stat.columbia.edu) <http://www.stat.columbia.edu/~kerman>

|         |                                                               |
|---------|---------------------------------------------------------------|
| mean.rv | <i>Distribution of the Arithmetic Mean of a Random Vector</i> |
|---------|---------------------------------------------------------------|

---

**Description**

mean.rv computes the distribution of the arithmetic average of its argument rv object.

**Usage**

```
## S3 method for class 'rv':
mean(x, ...)
```

**Arguments**

`x`                      an object  
`...`                    further arguments passed to or from other methods

**Details**

`mean.rv` gives the distribution (that is, a random variable object) of the statistic  $\frac{1}{n} \sum_{i=1}^n x_i$  (`sum(x)/length(x)`).

In particular, `mean(x)` of a random vector `x` of length one is equal to `x` as it would be in the case of numerical `x`.

To find the expectation of a random vector `x` (that is, the individual means of random components in a vector), use `rvmean(x)` (same as `E(x)` and `Pr(x)`).

|                    |                                                                       |
|--------------------|-----------------------------------------------------------------------|
| <code>nsims</code> | <i>Number of simulations stored in each component of an rv object</i> |
|--------------------|-----------------------------------------------------------------------|

---

**Description**

`nsims` returns the number of simulations stored in each component of its argument.

**Usage**

```
nsims(x)
```

**Arguments**

`x`                      an rv object

**Details**

If the argument is a number, `nsims` returns 1.

**Value**

A vector of integers.

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```
#
nsims(1.23)
x <- rvmnorm(1)
nsims(x)
nsims(x)==nrow(sims(x)) # Should be TRUE
nsims(x)==rvnsims()    # Should be TRUE
```

---

plot.rv

*Plotting Random Vectors*

---

**Description**

Draw a "random scatter plot". Currently only the y coordinate can be random, so intervals are plotted for each fixed x-coordinate..

**Usage**

```
## S3 method for class 'rv':
plot(x, y, what=c("95%", "50%", "mean", "median"), ylim=range(sims(y)), xlim=range(sims(x)))
```

**Arguments**

|       |                                                                       |
|-------|-----------------------------------------------------------------------|
| x     | (optional) fixed x-coordinate                                         |
| y     | random vector                                                         |
| what  | what to plot: an interval or a dot                                    |
| xlim  | the x limits of the plot                                              |
| ylim  | the y limits of the plot                                              |
| rvcol | colors for the intervals (passed on to <code>link{points.rv}</code> ) |
| ...   | other arguments passed on to <code>plot</code>                        |

**Details**

(This function is still under development.)

**Author(s)**

## References

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

## Examples

```
#
x <- 1:30
y <- rvmnorm(mean=x, sd=1)
## Not run: plot.rv(x,y) # x is not an rv, so be explicit and specify plot.rv
## Not run: plot(y)      # y is an rv, so R knows to call plot.rv.
```

---

points.rv

*Add Points and Intervals to a Plot*

---

## Description

Draw a sequence of points or uncertainty intervals at specified (fixed) x-coordinates.

## Usage

```
points.rv(x, y = NULL, what=NULL, rvcol=c("green", "red"), ...)
```

## Arguments

|       |                                                 |
|-------|-------------------------------------------------|
| x     | x-coordinates                                   |
| y     | y-coordinates                                   |
| what  | what to plot: intervals, means, medians...      |
| rvcol | colors for the intervals                        |
| ...   | further arguments passed to <code>points</code> |

## Details

```

---

|         |                                                             |
|---------|-------------------------------------------------------------|
| postsim | <i>Generate Posterior Simulations for lm or glm Objects</i> |
|---------|-------------------------------------------------------------|

---

### Description

Generate posterior simulations for a given fitted linear or general linear model, assuming the standard "noninformative" priors on the unknowns.

### Usage

```
postsim(fit)
## S3 method for class 'lm':
postsim(fit)
## S3 method for class 'glm':
postsim(fit)
```

### Arguments

`fit` an lm or glm object

### Value

A (named) random vector for each fitted coefficient.

### Author(s)

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

### References

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

### Examples

```
x <- 1:20
y <- rnorm(length(x), mean=x, sd=10)
print(summary(lm.fit <- lm(y ~ x)))
random.estimates <- postsim(lm.fit)
```

---

|          |                                                         |
|----------|---------------------------------------------------------|
| print.rv | <i>Print Distribution Summaries of Random Variables</i> |
|----------|---------------------------------------------------------|

---

### Description

`print.rv`

### Usage

```
print.rv(x, ...)
```

**Arguments**

`x`                    an rv object  
`...`                  further arguments passed to or from other methods

**Details**

`print.rv`

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**Examples**

```
print(rvnorm(mean=rvnorm(1)))
```

---

`quantile.rv`

*Distribution of a Quantile of a Random Vector*

---

**Description**

`quantile.rv` returns the distribution of the quantile of a random vector (as a random variable).

**Usage**

```
## S3 method for class 'rv':
quantile(x, ...)
```

**Arguments**

`x`                    an object  
`...`                  further arguments passed to or from other methods

**Value**

A random vector (rv object) with components giving the distribution of the desired quantiles.

**Note**

`quantile.rv` does not return the simulated quantiles of the quantiles of the argument `x`. This is done by [rvquantile](#).

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```
x <- rvmnorm(30)
quantile(x)
```

---

range.rv

*Distribution of the Range of a Random Vector*

---

**Description**

range.rv returns a 2-component random vector containing the distributions of the minimum and the maximum values of all the given arguments.

**Usage**

```
## S3 method for class 'rv':
range(..., na.rm=FALSE, finite=FALSE)
```

**Arguments**

|        |                                                                  |
|--------|------------------------------------------------------------------|
| ...    | further arguments passed to or from other methods                |
| na.rm  | logical, indicating if <a href="#">NAs</a> should be omitted     |
| finite | logical, indicating if all non-finite elements should be omitted |

**Details**

This is the rv-compatible version of the function [range](#).

**Author(s)**

**Examples**

```
x <- rvmnorm(mean=1:10, sd=1)
print(range(x))
print(quantile(x, c(0,1)))
```

---

|          |                                                    |
|----------|----------------------------------------------------|
| rowapply | <i>Apply a Function to Rows of a Random Matrix</i> |
|----------|----------------------------------------------------|

---

**Description**

rowapply takes a random matrix and applies a function to its rows, returning another rv object.

**Usage**

```
rowapply(X, FUN, ...)
```

**Arguments**

|     |                                                      |
|-----|------------------------------------------------------|
| X   | random matrix (an rv object with non-null dimension) |
| FUN | a function to apply                                  |
| ... | further arguments passed to FUN                      |

**Value**

A random variable (an rv object).

**Author(s)**

Jouni Kerman (kerman@stat.columbia.edu) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```
#
```

---

|            |                                                    |
|------------|----------------------------------------------------|
| Extract.rv | <i>Extract or Replace Parts of a Random Vector</i> |
|------------|----------------------------------------------------|

---

**Description****Details**

Extracting rv objects works the same way as extracting components of a numerical vector or array. The return value is always an object of class 'rv'. Type ?Extract for details.

**Value**

A random variable (an rv object).

## References

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

## Examples

```
#
```

---

|    |                       |
|----|-----------------------|
| rv | <i>Random Vectors</i> |
|----|-----------------------|

---

## Description

Creates or tests for objects of type “rv”.

## Usage

```
rv(length = 0)
as.rv(x)
is.rv(x)
is.random(x)
```

## Arguments

|        |                                 |
|--------|---------------------------------|
| length | desired length.                 |
| x      | object to be coerced or tested. |

## Details

rv creates a random vector vector of the specified length. The elements of the vector are all equal to 0.

is.rv returns TRUE if its argument is a rv object, FALSE otherwise.

as.rv attempts to coerce its argument to the random vector (rv) type.

is.random returns TRUE or FALSE for each component of the argument vector, depending on whether the component is a random variable object.

## Note

rv objects are internally lists with the class attribute set to “rv”.

## Author(s)

Jouni Kerman (kerman@stat.columbia.edu) <http://www.stat.columbia.edu/~kerman>

## References

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York. <http://www.stat.columbia.edu/~kerman/Research/postsim.pdf>

**See Also**

For a short version of the paper, type `doc("rv")`.

**Examples**

```
x <- rv(1)
```

---

rvAdapted

*Functions adapted to accept random variable (rv) objects*

---

**Description**

Functions that have been adapted to work with rv objects.

**Usage**

```
c(..., recursive=FALSE)
x %*% y
is.vector(x, mode="any")
max(..., na.rm = FALSE)
pmax(..., na.rm = FALSE)
min(..., na.rm = FALSE)
pmin(..., na.rm = FALSE)
median(x, na.rm = FALSE)
```

**Details**

These functions have been adapted to work with rv objects (since no *real* object-oriented generic version is available). They check whether an rv object has been passed as an argument; if false, the original function will be called.

To restore the original functions, detach the package; use `detachrv()`.

**Author(s)**

Jouni Kerman (kerman@stat.columbia.edu) <http://www.stat.columbia.edu/~kerman>

|--------|-------------------------------------|
| rvRhat | <i>R-hat Convergence Diagnostic</i> |
|--------|-------------------------------------|

---

**Description**

Retrieves the R-hat convergence diagnostic for each component of the argument

**Usage**

```
rvRhat(x)
```

**Arguments**

`x`                      an object

**Details**

The R-hat values are assumed to be saved as attributes. If they are not available, NA will be returned.

**Value**

Vector of numbers, NA if R-hat is not available.

**rvbern***Generate a Random Vector from a Bernoulli Sampling Model*

---

**Description**

rvbern generates a random vector where each simulation comes from a Bernoulli sampling distribution.

**Usage**

```
rvbern(n=1, prob)
```

**Arguments**

|      |                                                         |
|------|---------------------------------------------------------|
| n    | number of random scalars to draw                        |
| prob | probability of “success”; may be a random vector itself |

**Details**

rvbern is a special case of rvbinom with the argument size=1.

**Value**

A random vector (an rv object) of length n.

**Note**

The resulting vector will not be independent and identically distributed Bernoulli unless prob is a fixed number.

**Author(s)**

Jouni Kerman (kerman@stat.columbia.edu) <http://www.stat.columbia.edu/~kerman>

|---------|-----------------------------------------------------------------|
| rvbinom | <i>Generate Random Variables from a Binomial Sampling Model</i> |
|---------|-----------------------------------------------------------------|

---

**Description**

Generates a random vector from a binomial sampling model.

**Usage**

rvbinom(n=1, size, prob)

**Arguments**

|      |                                                                              |
|------|------------------------------------------------------------------------------|
| n    | integer, number of random variables to generate                              |
| size | integer or integer-valued rv: the number of trials (size of each sample)     |
| prob | prior probability of success of each trial (may be constant or an rv object) |

**Details**

`rvbinom` generates a random vector with given length, the distribution for size and the distribution for the probability of success.

**Value****Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```
s <- 1+rvpois(1,lambda=3)      # A prior distribution on the 'size' parameter.
rvbinom(1, size=s, prob=0.5)  # The 'size' is random.
p <- rvbinom(1, 10, prob=0.5)/10 # Prior probability of success.
rvbinom(1, size=10, prob=p)    # Now the probability is random.
rvbinom(1, size=s, prob=p)     # Both the size and the probability are random.
```

---

rvboot

---

*Generate a Random Vector from an Empirical Distribution*

---

**Description**

`rvboot` generates a random vector of the same length as data from the empirical distribution of the data.

**Usage**

```
rvboot(data)
```

**Arguments**

`data`                      A vector of constants

**Details**

`rvboot`

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```

y <- rnorm(30) # Some data.
x <- rvboot(y) # A random vector of length 30 (each component has the same distribution)
print(mean(x)) # Bootstrap estimate of the mean.
print(sd(x))   # Bootstrap estimate of the sd.
rvinci(mean(x), 0) # Hypothesis test: mean of x is zero (at 5

```

---

rvcauchy

Generate Random Variables from a Cauchy Sampling Model

---

**Description**

Random vector generation for the Cauchy distribution.

**Usage**

```
rvcauchy(n=1, location=0, scale=1)
```

**Arguments**

|          |                                          |
|----------|------------------------------------------|
| n        | integer: number of variables to generate |
| location | location parameter (may be random)       |
| scale    | scale parameter (may be random)          |

**Details**

For details on the Cauchy distribution, see [Cauchy](#). See also [rvt](#); Cauchy is a special case of the t-distribution with 1 degree of freedom, and therefore `rvcauchy(n, location, scale)` is equivalent to `rvt(n, mu, scale, df=1)`.

**Value**

A random vector (rv object) of length n.

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

---

**Description**

Generates a random vector from a chi-square sampling model.

**Usage**

```
rvchisq(n=1, df, ncp = 0)
```

**Arguments**

|     |                                            |
|-----|--------------------------------------------|
| n   | number of variables to generate            |
| df  | integer, degrees of freedom, may be random |
| ncp | non-centrality parameter, may be random    |

**Details**

If any of the arguments are random, the resulting simulations may have non-Poisson marginal distributions.

**Value**

A random vector (rv object) of length n.

---

|      |                                                            |
|------|------------------------------------------------------------|
| rvci | <i>Credible (Uncertainty) Intervals for Random Scalars</i> |
|------|------------------------------------------------------------|

---

**Description**

Computes credible (uncertainty) intervals for a given vector.

**Usage**

```
rvci(obj, interval=0.95, one.sided=FALSE, left=TRUE)
```

**Arguments**

|           |                                                               |
|-----------|---------------------------------------------------------------|
| obj       | random scalar or vector                                       |
| interval  | a number between 0 and 1                                      |
| one.sided | logical, FALSE if two-sided interval is desired               |
| left      | logical, indicating if the left one-sided interval is desired |

**Value**

For two-sided intervals, an array of numbers of dimension `c(2, length(x))`, for one-sided intervals, a vector of the same length as `x`.

**rvdirichlet**
*Generate Random Variables from a Dirichlet Sampling Model*

---

**Description**

Generates random variables from a Dirichlet sampling model.

**Usage**

```
rvdirichlet(n=1, alpha)
```

**Arguments**

|       |                                        |
|-------|----------------------------------------|
| n     | integer: number of vectors to generate |
| alpha | the parameter vector                   |

**Details**

The Dirichlet distribution is a generalization of the Beta distribution. (If alpha is of length two, `rvdirichlet` draws from the Beta model.)

**Value**

A random vector (rv object) of length n.

|--------|-----------------------------------------|
| rvmean | <i>Expectation of a Random Variable</i> |
|--------|-----------------------------------------|

---

**Description**

rvmean

**Usage**

```
rvmean(x, ...)
```

**Arguments**

|                  |                                               |
|------------------|-----------------------------------------------|
| <code>x</code>   | an rv object                                  |
| <code>...</code> | further arguments passed to <code>mean</code> |

**Details**

`rvmean` computes the means of the simulations of all individual components of a random vector (rv) object.

`E` is an alias for `rvmean`, standing for “Expectation.”

`Pr` is another alias for `rvmean`, standing for “Probability of”; suggested to be used when the argument is a logical statement involving random variables (that is, a description of an event such as  $x > 0$  or  $x > y$ ). Then `Pr( $x > 0$ )` gives the probability of the event “ $x > 0$ ”. The statement  `$x > 0$`  returns a Bernoulli (indicator) random variable object (having 1/0 or TRUE/FALSE values) and the expectation of such variable is just the probability of the event where the indicator is one.

**Value**

A numerical vector with the same dimension as `x`.

```
#
```

---

|        |                                                                          |
|--------|--------------------------------------------------------------------------|
| rvnorm | <i>Generate Random Variables from a Gaussian (Normal) Sampling Model</i> |
|--------|--------------------------------------------------------------------------|

---

**Description**

Generates a random vector from a Gaussian sampling model.

**Usage**

```
rvnorm(n=1, mean=0, sd=1, var=NULL, precision)
```

**Arguments**

|           |                                                                        |
|-----------|------------------------------------------------------------------------|
| n         | integer: number of variables to generate                               |
| mean      | mean, may be a rv                                                      |
| sd        | standard deviation; scalar or vector (constant or rv, not matrix)      |
| var       | variance, can be given instead of sd. Scalar, vector, or matrix.       |
| precision | inverse variance or variance matrix, may be given instead of sd or var |

**Value**

A random vector (rv object) of length n.

**Note**

If any of the arguments are random, the resulting simulations may have non-normal marginal distributions; for example, if an inverse-chi-squared scalar rv `var` and zero `mean` is given, the resulting rv will have a t-distribution.

|                     |                                                              |
|---------------------|--------------------------------------------------------------|
| <code>rvpois</code> | <i>Generate Random Vectors from a Poisson Sampling Model</i> |
|---------------------|--------------------------------------------------------------|

---

**Description**

Generates random variables from a Poisson sampling model.

**Usage**

```
rvpois(n=1, lambda)
```

**Arguments**

`n`                    integer: number of variables to generate  
`lambda`            a vector of (positive) mean parameters; (may be random)

**Note**

If any of the arguments are random, the resulting simulations may have non-Poisson marginal distributions.

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```
x <- rvpois(lambda=10) # A Poisson rv with mean 10
lbd <- rvchisq(1,1)    # Some positive rv
y <- rvpois(lambda=lbd) # Not a Poisson rv, although each simulation is a draw from Poi
```

---

**rvquantile***Componentwise Quantiles of Random Variables*

---

**Description**

Computes componentwise quantiles of random vectors or arrays.

**Usage**

```
rvquantile(x, ...)
```

**Arguments**

`x`                    an object  
`...`                further arguments passed to `quantile`

**Details**

`rvquantile` applies the `quantile` function to each column of `sims(x)`.

**Value**

A *numeric* vector of quantiles.

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

```

---

**rvrange***Range of Simulations in a Random Variable*

---

**Description**

Returns the range (min, max) of the simulations for each component of the given random vector or array.

**Usage**

```
rvrange(x, ...)
```

**Arguments**

|     |                           |
|-----|---------------------------|
| x   | an rv object              |
| ... | arguments passed to range |

**Details**

rvrange

**Value**

A numeric (constant) array with 2 rows (=min, max) and `length(x)` columns.

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**See Also**

[range.rv](#) returns the *distribution* of the range of a random vector.

**Examples**

```
#
```

---

**rvsample***Sample from the Simulation Matrix of a Random Variable*

---

**Description**

Draws a sample of desired size from each component of a given random variable `x`.

**Usage**

```
rvsample(x, size=1, replace=TRUE, prob=NULL)
```

**Arguments**

|                      |                                                 |
|----------------------|-------------------------------------------------|
| <code>x</code>       | an object                                       |
| <code>size</code>    | size of the sample                              |
| <code>replace</code> | sample with replacement?                        |
| <code>prob</code>    | optional probability vector, usually not needed |

**Details****Value**

A numeric array of dimensions `size` times `length(x)`.

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**References**

**Examples**

```
#
```

---

|      |                                                  |
|------|--------------------------------------------------|
| rvsd | <i>Variances of Components of Random Vectors</i> |
|------|--------------------------------------------------|

---

**Description**

Computes the means of the simulations of all individual components of a random vector (rv) object.

**Usage**

```
rvsd(x, ...)
```

**Arguments**

|     |                                              |
|-----|----------------------------------------------|
| x   | an object                                    |
| ... | further arguments passed to <code>var</code> |

**Details**

rvsd applies the function `sd` to the vector of simulations of each component of `x`, thus computing "columnwise" standard deviations of the matrix of simulations of `x`.

#
```

---

|               |                                                            |
|---------------|------------------------------------------------------------|
| <b>rvsims</b> | <i>Create a Random Vector from a Matrix of Simulations</i> |
|---------------|------------------------------------------------------------|

---

**Description**

rvsims takes a vector, matrix, or 3-way array (sims) containing simulations, and returns a random vector (an object of type 'rv')

**Usage**

```
rvsims(sims, n.sims=rvnsims(), permute=FALSE, save.order=FALSE)
```

## Arguments

|                         |                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>sims</code>       | an array of simulations (1, 2, or 3-dimensional)                                                              |
| <code>n.sims</code>     | number of simulations to save                                                                                 |
| <code>permute</code>    | logical, indicate if scramble the simulations                                                                 |
| <code>save.order</code> | logical, indicate if the original order of simulations should be saved (only if <code>permute</code> is TRUE) |

## Details

A vector is interpreted to contain simulations for one single random variable; if `sims` is two-dimensional, the columns are supposed to contain simulations for several random variables. If `sims` is three-dimensional, it is supposed to be output from a Markov chain simulation program: the first dimension corresponds to the simulations, the second corresponds to the chains (typically 3 or 5), and the last dimension corresponds to the variables.

If `permute` is TRUE, the simulations are scrambled, i.e. the *rows* are permuted randomly. If `permute=TRUE` and `save.order=TRUE`, the original order of the simulations is saved in an attribute `rvsim$order`.

If `sims` is three-dimensional, the simulations are always scrambled.

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

## References

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

## Examples

```
# x and y have the same distributions:
x <- sims(rnorm(1000))
y <- rvsim(1)
```

---

rvt

---

*Generate Random Variables from a Student-t Sampling Model*

---

## Description

Generates a random variable from a Student-t sampling model.

## Usage

```
rvt(n=1, mu=0, scale=1, df, Sigma)
```

**Arguments**

|       |                                                       |
|-------|-------------------------------------------------------|
| n     | integer, number of scalars to generate                |
| mu    | location, may be a rv                                 |
| scale | scale, may be a rv                                    |
| Sigma | (optional) scaling matrix for multivariate generation |
| df    | degrees of freedom, may be a rv                       |

**Details**

This function generates both univariate (independent and identically distributed) Student-t random variables and multivariate Student-t distributed vectors (with a given scaling matrix).

**Note**

If any of the arguments are random, the resulting simulations may have non-t marginal distributions.

|------|---------------------------------------------------|
| sims | <i>Retrieve the Simulations of Random Vectors</i> |
|------|---------------------------------------------------|

---

**Description**

Returns the simulation matrix for the random variable object x.

**Usage**

```
sims(x, n.sims=NULL, dimensions=FALSE, sim.matrix=FALSE, mc.array=FALSE)
## Default S3 method:
sims(x, ...)
## S3 method for class 'rv':
sims(x, n.sims=NULL, dimensions=FALSE, sim.matrix=FALSE, mc.array=FALSE)
```

**Arguments**

|                         |                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>x</code>          | a random variable object                                                                                                                                    |
| <code>n.sims</code>     | (optional) number of simulations                                                                                                                            |
| <code>dimensions</code> | logical, try to preserve the dimensions of <code>x</code>                                                                                                   |
| <code>sim.matrix</code> | logical, (if <code>dimensions</code> is <code>TRUE</code> ) indicate if want to return the plain simulation matrix as attribute “ <code>sim.matrix</code> ” |
| <code>mc.array</code>   | logical, indicate if want to return the original 3-way mcmc matrix, if possible                                                                             |
| <code>...</code>        | omitted arguments                                                                                                                                           |

**Details**

`sims` returns the matrix of simulations for a given random variable object `x`.

**Author(s)**

Jouni Kerman ([kerman@stat.columbia.edu](mailto:kerman@stat.columbia.edu)) <http://www.stat.columbia.edu/~kerman>

**References**

Kerman, Jouni and Gelman, Andrew. Manipulating and Summarizing Posterior Simulations Using Random Variable Objects. Technical report, Columbia University, New York.

**Examples**

```
x <- rvmnorm(24)           # Suppose that L is the number of simulations per scalar
dim(x) <- c(2,3,4)
dim(sims(x))               # Lx24
dim(sims(x, dimensions=TRUE)) # Lx2x3x4
dim(attr(sims(x, dimensions=TRUE, sim.matrix=TRUE), "sim.matrix")) # Lx24
## Not run: dim(sims(x, mc.array=TRUE)) # Error: x was not generated by a mcmc process
```

---

sort

*Distribution of Order Statistics of a Random Vector*

---

**Description**

`sort` is a replacement for the standard `sort` function, which is called if `x` is not an `rv` object.

**Usage**

```
sort(x, ...)
```

**Arguments**

|                  |                                               |
|------------------|-----------------------------------------------|
| <code>x</code>   | an object                                     |
| <code>...</code> | further arguments passed to <code>sort</code> |

**Details**

Once `sort` becomes a generic (and truly object-oriented) method, this function will also become a truly object-oriented method.

**Author(s)**

Jouni Kerman (kerman@stat.columbia.edu) <http://www.stat.columbia.edu/~kerman>

---

`split.rv`

*Split a Random Vector into a List by Name*

---

**Description**

Split a random vector into a list by name.

**Usage**

```
split.rv(x, f, drop=FALSE, ...)
```

**Arguments**

|                   |                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------|
| <code>x</code>    | a random vector                                                                                             |
| <code>f</code>    | a “factor” that specifies the grouping, by default the variable names derived from <code>names{x}</code> .  |
| <code>drop</code> | logical indicating if levels that do not occur should be dropped (if <code>f</code> is a factor or a list). |
| <code>...</code>  | further potential arguments passed to methods.                                                              |

**Details**

If `f` is omitted, splitting is done by `names(x)`, but with the possible brackets (as in “`alpha[10]`”) omitted.
